

MXtreme™ Reporting

The MXtreme™ Mail Firewall is a powerful tool for managing, controlling and filtering the flow of email messages in and out of an organization.

Maximizing > Your Investment

The MXtreme Reporting Module, introduced in Version 3.0, further enhances the value of the mail firewall by giving detailed deployment and usage metrics which enable your organization to maximize its investment in its email infrastructure.

Managers can now receive automatic emailed reports on email traffic, spam filtering activity, viruses detected, system health and other vital details of MXtreme's activity.

The email database allows the administrator to search for and look up any message that has passed through the system to determine its disposition. "What happened to that message?" is a question that can now be quickly answered.

Benefits >

Key Benefits

MXtreme Reporting enables you to:

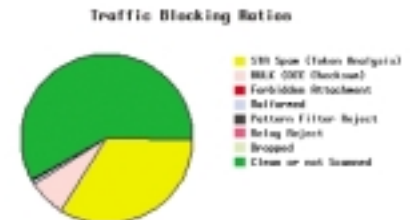

- Implement capacity planning capabilities
- Avoid bottlenecks
- Fine tune policies to maximize productivity
- Reduce the cost of deploying and managing your email infrastructure
- Take the guess-work out of deploying and managing email

Reports >

MXtreme reports can be easily configured. Users can choose from a range of pre-configured reports or create their own.

Reports are available in several formats:

- HTML for easy online viewing or inclusion in an email
- PDF for portability
- CSV provides a way to import the information into an Excel spreadsheet for further analysis
- PS allows the report to be printed from a wide range of systems.

Reports can be generated in an ad-hoc fashion, or scheduled. In both cases, the user can specify exactly what time-period should be reported. For example, the user can specify that the report should be generated each week at Sunday 9 a.m., that the report period should be from Sunday 1 a.m. to Saturday midnight.

Email Database >

All messages that pass through the MXtreme system are recorded in the database. The content is not retained – only information about the source and destination, message headers and what processing was applied.

Finding a message is easy – simply enter the text to find based on any part of the message header (sender, recipient, subject etc.) or on what happened to the message (bounced, filtered, quarantined, etc.).

Message List
Records 91 to 100 (of 1800)
